

### **Task 3**

#### Objective:

The objective of this assignment is to give students hands-on experience in developing a web page that captures information and saves it to a database, and then retrieves the information from the database and displays it on another web page.

#### Instructions:

Create a table named 'products' inside the dwdb.

Create a web page with a form that captures and saves to the database the following product information:

- Product name
- Product description
- Product price
- Product image (optional)

Create another PHP page that retrieves the product information from the 'products' table and displays it in a table on a separate web page.

#### Requirements:

The web page should have a clean mobile responsive user-friendly interface.

The product information displayed on the second web page should be formatted in a clear and organized manner.

(Optional) If you are up for it, implement login and logout so that only a logged in user can access the page to enter products. The page that displays all the products should be available to both logged in users and those who are not logged in.

**Happy Hacking!!**
